Software Engineer with 4+ years of experience working across frontend and backend systems to build performant, reliable features for high-traffic, revenue-driven products.

Skills

Languages: HTML, CSS, JavaScript(ES6+), TypeScript, Go, SQL, GraphQL

Technologies: React, Next.js, Node, ApolloJS, Prisma, Tailwind CSS, Sass, Styled Components, Framer Motion, Storybook, Cypress, Playwright, Webpack, Docker, ElasticSearch, AWS (Lambda, S3), PayloadJS, KeystoneJS, Lexical, Git

Experience

Software Engineer · Fullness Web Solutions · Remote

July 2021– Present

- Engineered **Canstar's** new multi-tenant website serving **100k+ monthly organic visitors**, laying the foundation for migrating multiple high-traffic verticals from the old stack. Technologies used: React.js, Next.js, GraphQL and Elasticsearch.
- Built a config-driven filtering framework where verticals could define their own config descriptors, reducing onboarding effort and ensuring consistent UI/UX across product tables.
- Owned a mission-critical component controlling navigation to provider pages with dynamic flows based on vertical and monetisation model. As a core revenue pathway, its reliability directly influenced business performance.
- Contributed to a Golang microservice and integrating it with the frontend product table to serve real-time priced products, driving a **3× revenue increase**.
- Built a serverless **data ingestion pipeline** syncing product & content data from legacy and new CMS systems into Elasticsearch, powering fast, unified product search across verticals.
- Improved Core Web Vitals across the entire platform, **reducing poor URLs by ~90%** and driving significant SEO ranking gains and organic traffic growth.
- Implemented a audit system across golang and graphql services that **streamed user-facing data to GCP pub/sub**, creating a durable event pipeline for compliance and marketing use cases, and accelerating conflict resolution.
- Prototyped multiple CMS solutions for content authors to review, influencing the decision to migrate to new CMS.
- Developed a security & dependency-health dashboard integrating package registries and Snyk, which drove ~60% remediation of vulnerable or out-of-SLA packages across teams.
- Introduced Cypress-based **E2E test coverage** for mission-critical flows, preventing regressions across verticals and improving release stability.
- Migrated Node microservices to **TypeScript + GraphQL** tooling, improving type-safety, reducing production bugs, and speeding up developer onboarding.
- Built an embeddable Broker Widget in React, used across partner websites to funnel home-buyer leads.
- Delivered new user-facing features, improved UX with micro-interactions and accessibility enhancements, collaborating with design and product to ship a more app-like interface.

Education

Priydarshini College of Engineering, RTMNU
BE Computer Technology 2017 - 2021 | CGPA 9.39

Interests

Running, Cyberpunk Fiction, Formula 1
